Dear Editors,

Please consider the enclosed manuscript entitled

*Governing Interruptions After Deterministic Deterioration Scoring:
A Retrospective Evaluation on PhysioNet Challenge 2019*

for publication as a **Research and Applications** article in *JAMIA Open*.

Significance. Most retrospective deterioration studies treat a positive score as the alert. We instead evaluate the interruption decision as a separable, versioned policy that runs after a deterministic score and before a page is emitted. Using the public PhysioNet/Computing in Cardiology Challenge 2019 dataset, we tuned a dual-lane governance policy on setA, froze it with a content hash, and evaluated setB once. The governed path matched threshold-only partial-SOFA detection (79.5%, 95% CI 77.0–81.8) while the interruptive lane emitted 13.2% as many alerts. Normalized Challenge utility was -0.111 , -0.053 , and 0.041 for threshold-only, governed, and interruptive streams. Against hourly SIRS, incomplete NEWS2, and partial qSOFA on the same window, and through drop-one mechanism ablations, we localize the burden reduction to a 90-minute refractory interval and a page gate. We believe this mechanism-level, fully reproducible treatment of alert governance fits *JAMIA Open*’s readership in clinical decision support and alert fatigue.

Originality. This manuscript is entirely original. It has not been copyrighted, published, submitted, or accepted for publication elsewhere. No preliminary conference version has been published.

Human subjects and data. No new human-subjects data were collected. The evaluation uses the publicly available, de-identified PhysioNet Challenge 2019 v1.0.0 resource (CC-BY 4.0). The author has no institutional affiliation that requires ethics-board review of this secondary analysis. This is a retrospective offline evaluation against a proxy label, not clinical validation. It makes no claim of diagnosis, outcome improvement, external validity, or regulatory readiness.

Conflicts of interest. The author has no conflicts of interest to disclose.

Related papers and prior review history. None.

Generative artificial intelligence disclosure. Generative AI tools (OpenAI Codex / GPT-5 and related assistants, accessed 2025–2026) assisted with software implementation for the underlying prototype, manuscript organization, language editing, code review, and L^AT_EX formatting. I directed the work, verified all reported analyses against frozen artifacts, and take full responsibility for the submitted content. These tools are not authors.

Thank you for your consideration.

Sincerely,

Satya Venkata Ranga Janaki Sriram
